

The settings for the MINI cars with/without steering wheel controls are different. Usually, we setup the setting correctly to match with your car before shipping. But if you provide us the wrong information of the car and we may setup the setting which is not compatible with your car, and you need to change it before you can use the radio normally. Please check the below instructions how to change the settings.

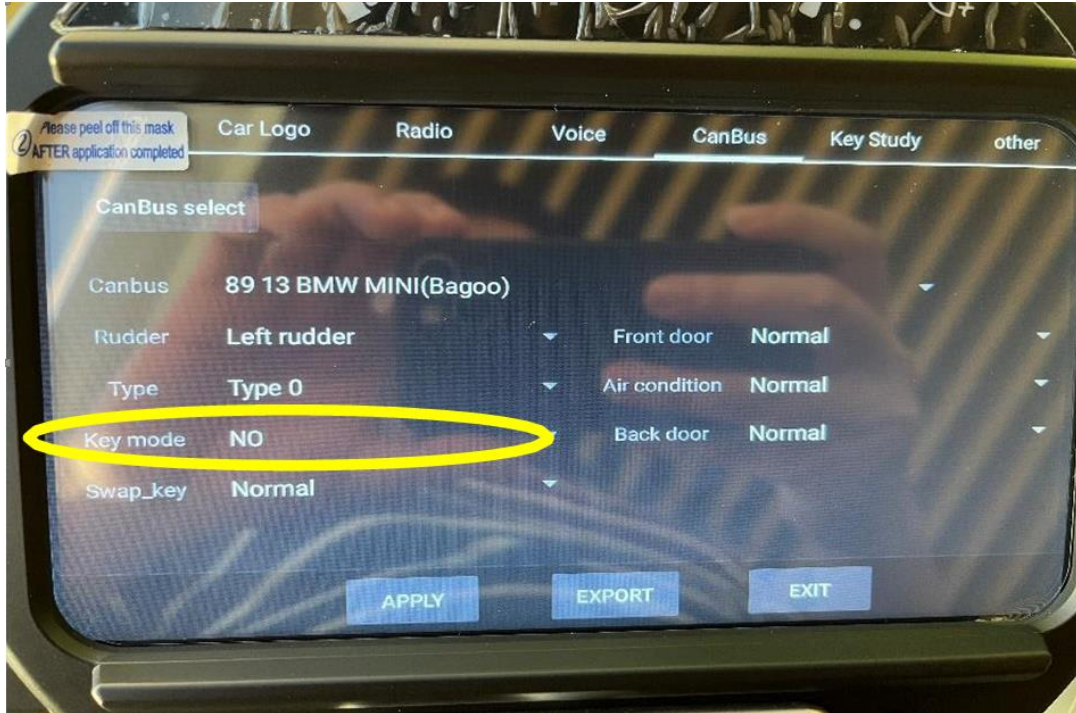

Step 1. Please power off the car first and the radio will power off.

Step 2. Bridge the yellow wire and red wire together as shown below, you should be able to power on the radio again.

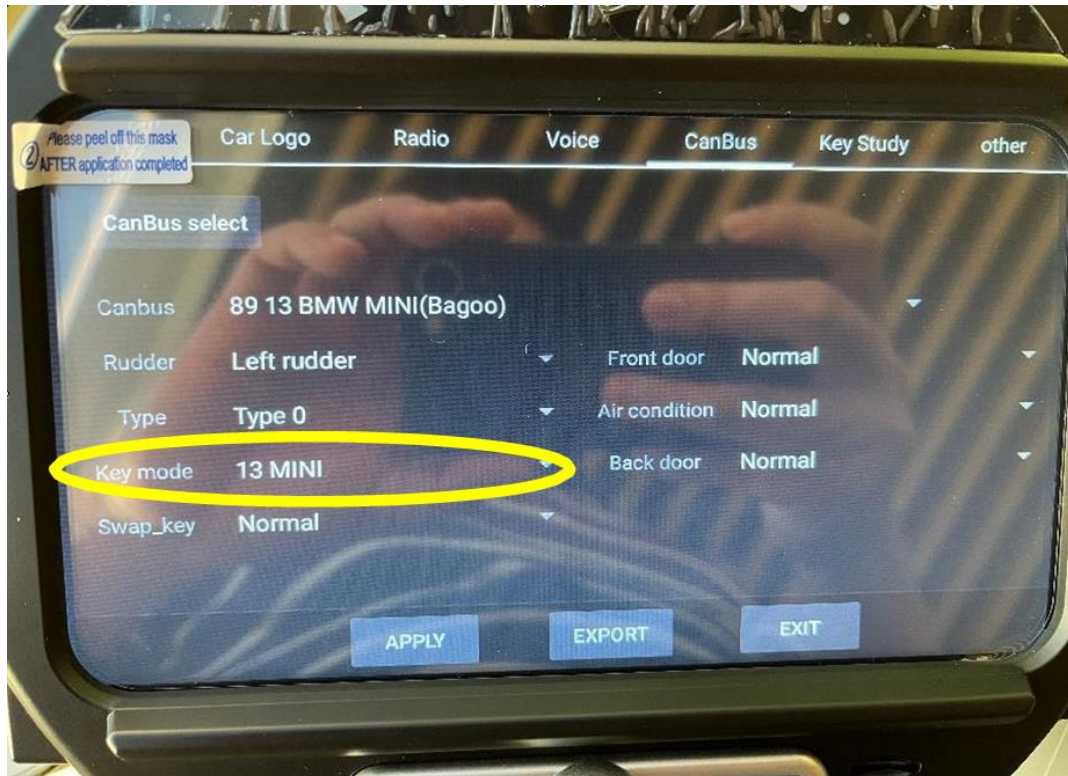

Step 3. Check Settings>CAR>Factory settings>Input password 318>CANBUS>Key mode

If the car is equipped with factory installed steering wheel control buttons, please select "NO". Then APPLY and EXIT. The radio will reboot.

If the car is NOT equipped with factory installed steering wheel control buttons, please select "13 MINI". Then APPLY and EXIT. The radio will reboot.

Step 4. You can remove the bridge clip between the yellow wire and red wire and start the engine, the radio will work normally after restarts.
